Gloves for Lab Processes

Millions of people are buying gloves and getting ripped off. 🧤 They tricked me too 😓 until now.

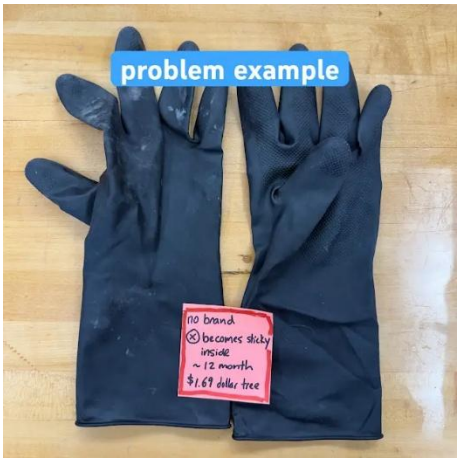

As I worked a hole in my Milwaukee gloves I realized I let the hardware store choose my gloves. I let the hardware store decide how to protect the 2 most important tools in my life. My hands. Why didn't I learn? In 2009 and after, i've worked in some of the world's most advanced facilities 🏭 where gloves are worn and I had noticed the gloves there. The professionals buy gloves that don't look like the ones I buy at Home Depot or Harbor Freight. Why? It's because I never actually chose a glove. I let the retailer choose for me. Whatever I saw on the shelf that looked cool. We can do a lot better than that. 🤓🔧

🚘 Engine assembly takes place with woven gloves. They have better conformity to the hand and better flexibility so the worker can feel the parts they work with. They feature a rubber front layer for grip and a fabric backside for breathability. They protect from cuts effectively just like mechanics gloves but they're lighter and actually stronger, with fibers like Kevlar and advanced composite materials from decades of research. And the price is actually lower than most of those hardware store options. Since they're made from one solid woven part, they don't drop debris in sensitive assemblies as they wear.

I decided last week to research gloves and choose. Simply choosing puts me FAR ahead of not choosing. The black washing gloves are an example. After 6 months the inside surface degraded and they felt sticky. I washed, but it was unrecoverable. Maybe they encountered an incompatible substance. Well, I cannot correct this because there is no datasheet. I can't read the technical datasheet and choose an alternative because there IS NO brand or datasheet. If I hire a helping hand with a different size, I can't equip them with gloves.

So the key point of the blue gloves shown: they carry all sizes, they list the chemical resistance compatibility, they answer all the needs just like a glove manufacturer should do it. So I am recommending 3 kinds of gloves for prototyping labs and If I learn of a shortcoming I can update my recommendations! So easy! Please consider spending $3 plus shipping on some professional rubber gloves like these - even less than the price at your grocery store. Assembly gloves for $7 and mechanics gloves for $16.

If you want to learn more, I've documented the choices and links, and even the research behind the choices, on OpenLab. It's https://qr.net/openlabproject. See the Sidebar, tap "tools" and find subheading "safety". Includes tabulated part numbers and amazon links.
